SOLUTION BRIEF

# Vantage® Workflow from Telestream running on a XenData Archive Server
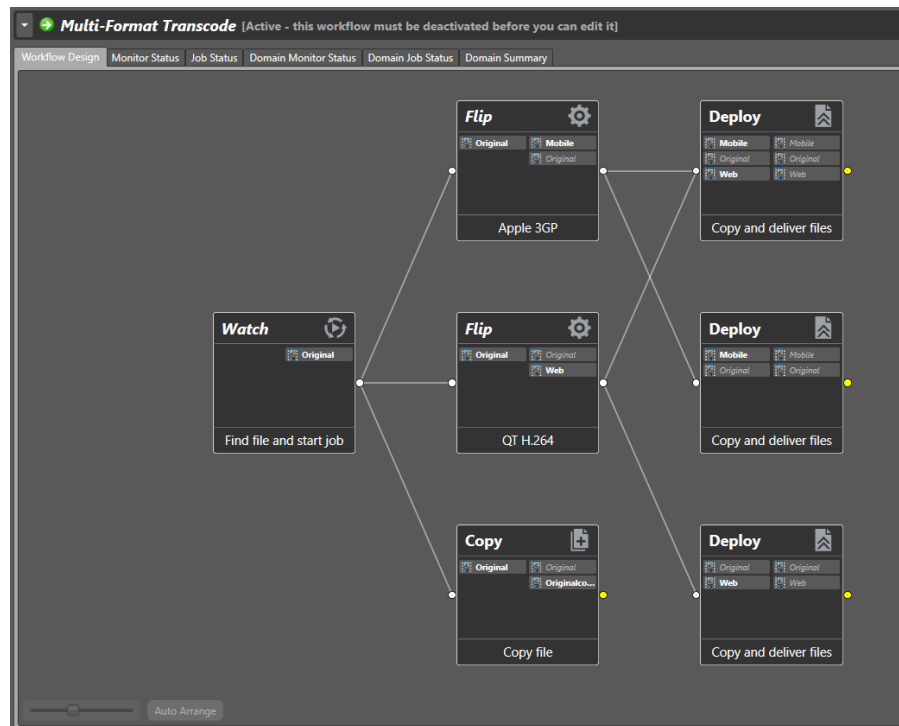

XenData

**Vantage**
Media Processing Platform

**Vantage Workflow – Telestream**

Scalable, intelligent workflow automation for file-based content production and multi-channel distribution. The Vantage Media Processing Platform brings transcoding, media capture, metadata processing, and analysis into a single, unified system with the ability to automate complex decision making and workflow decision.

**Video Archives – XenData**

XenData video archives provide highly scalable long-term storage based on LTO robotic libraries, hybrid cloud or disk-based object storage. All run on a Windows OS and are available with a file system interface, an object storage S3 interface and APIs. They offer proven compatibility with a wide range of complementary products, including many Media Asset Management systems.

Vantage Workflow can run on a XenData archive appliance or server to provide automatic creation of proxies. XenData policies may be configured to keep high-resolution original files on local storage and low-resolution proxies in the cloud.
